# Data Dictionary Report

Field definitions and relationships for the Sales, Customers, Products, Stores and Exchange Rates tables

Source file: Data_Dictionary.csv
Dataset: Global Electronics Retailer (fictitious) sales data
Report generated: October 19, 2026

# 1. Purpose and overview

This document describes the structure of the Global Electronics Retailer dataset. The data dictionary contains 37 field definitions across 5 tables: Customers (10 fields), Products (10 fields), Sales (9 fields), Stores (5 fields), Exchange Rates (3 fields). The dataset is fictitious and covers transactions, products, customers, stores and currency exchange rates for a global electronics retailer.

The Sales table is the central fact table. Each row in Sales is one line item of an order. It links to the Customers table through CustomerKey, to the Products table through ProductKey, and to the Stores table through StoreKey. The Exchange Rates table links to Sales by date and currency code, which allows order values to be converted between currencies.

# 2. Table relationships

| From table | To table | Join key | Cardinality |
|---|---|---|---|
| Sales | Customers | CustomerKey | Many sales rows to one customer |
| Sales | Products | ProductKey | Many sales rows to one product |
| Sales | Stores | StoreKey | Many sales rows to one store (StoreKey 0 is the online store) |
| Sales | Exchange Rates | Order Date + Currency Code | Daily rate for the currency used on the order |

Table 1. Relationships between tables.

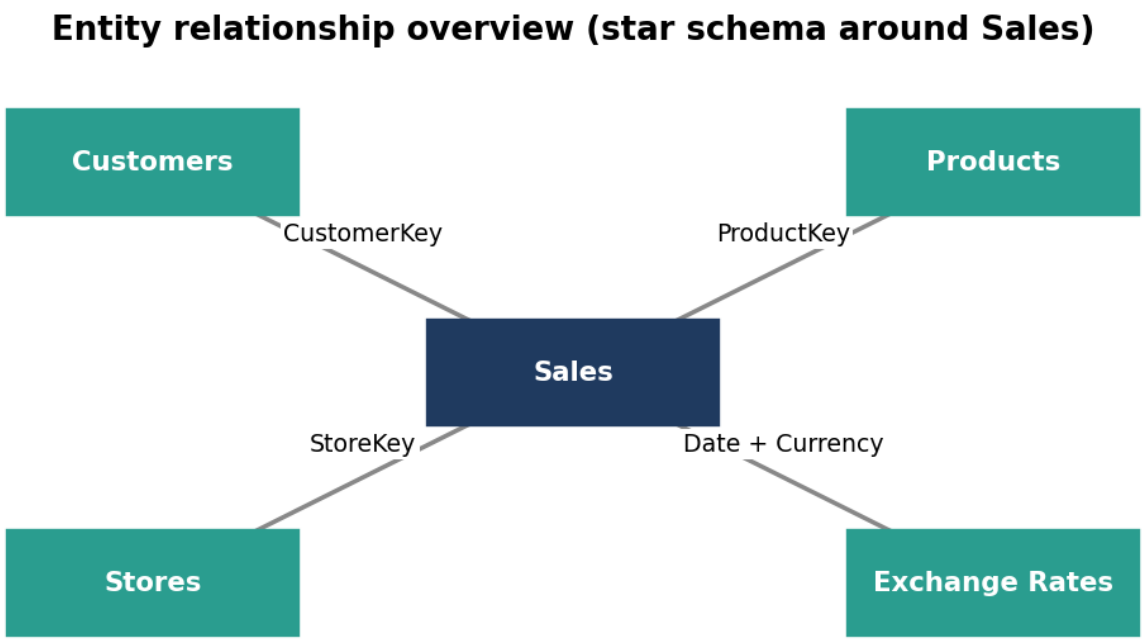

**Figure 1.** Entity relationship overview. Sales is the central fact table connected to Customers, Products, Stores and Exchange Rates.

# 3. Field definitions

## Sales table

| Field | Description |
|---|---|
| Order Number | Unique ID for each order |
| Line Item | Identifies individual products purchased as part of an order |
| Order Date | Date the order was placed |
| Delivery Date | Date the order was delivered |
| CustomerKey | Unique key identifying which customer placed the order |
| StoreKey | Unique key identifying which store processed the order |
| ProductKey | Unique key identifying which product was purchased |
| Quantity | Number of items purchased |
| Currency Code | Currency used to process the order |

## Customers table

| Field | Description |
|---|---|
| CustomerKey | Primary key to identify customers |
| Gender | Customer gender |
| Name | Customer full name |
| City | Customer city |
| State Code | Customer state (abbreviated) |
| State | Customer state (full) |
| Zip Code | Customer zip code |
| Country | Customer country |
| Continent | Customer continent |
| Birthday | Customer date of birth |

## Products table

| Field | Description |
|---|---|
| ProductKey | Primary key to identify products |
| Product Name | Product name |
| Brand | Product brand |
| Color | Product color |
| Unit Cost USD | Cost to produce the product in USD |
| Unit Price USD | Product list price in USD |
| SubcategoryKey | Key to identify product subcategories |
| Subcategory | Product subcategory name |
| CategoryKey | Key to identify product categories |
| Category | Product category name |

## Stores table

| Field | Description |
|---|---|
| StoreKey | Primary key to identify stores |
| Country | Store country |
| State | Store state |
| Square Meters | Store footprint in square meters |
| Open Date | Store open date |

### Exchange Rates table

| Field | Description |
|---|---|
| Date | Date |
| Currency | Currency code |
| Exchange | Exchange rate compared to USD |

## 4. Usage notes

- Revenue is not stored directly in Sales. It is computed as Quantity multiplied by Unit Price USD from the Products table.
- Profit is computed as Quantity multiplied by the difference between Unit Price USD and Unit Cost USD.
- Delivery Date is blank for in-store purchases and populated for online orders (StoreKey 0).
- Exchange rates are expressed relative to USD, so USD always equals 1.
- Currency Code on a sale is the currency in which the order was processed, not the currency of the Products price list, which is always USD.
